ACKNOWLEDGEMENTS

The Food and Agriculture Organization is greatly indebted to the following individuals and institutions who assisted the project in one way or another to compile the information given in this series of reports.

- Mr A.M. Anisuzzaman, Secretary, Ministry of Agriculture, who initiated the request for the agroecological zones study to be carried out and who maintained an active interest in the progress of the study through to its completion.
- Mr K.M. Ejazul Huq, Joint Secretary (Planning), Ministry of Agriculture, for his constant interest in and support of the project.
- Officers and staff of the Bangladesh Soil Resources Development Institute (SRDI), past and present, whose reports on reconnaissance soil surveys and soil moisture studies provided the basis for the information on soils, landforms and inundation characteristics presented in the reports.
- The Bangladesh Meteorological Department and the Surface Water Hydrology Directorate of the Bangladesh Water Development Board (BWDB) which provided climatic data.
- The Master Plan Organization of the Ministry of Irrigation, Water Development and Flood Control which provided the groundwater data used for the analysis of inundation regimes.
- Messrs A.M. Ibrahim, A.B.M. Fazlul Hoque and Belayetul Karim Chowdhury, national consultants, and Mr Serajul Islam, Principal Scientific Officer, SRDI, and National Project Coordinator, who assisted in delineating, measuring and verifying the units shown on the Agroecological Map. Messrs Ibrahim and Islam also assisted in checking and correcting much of the computer data and in many other ways.
- Mr Mahbub Ahmed, Senior Computer Programmer, BARC, Mr Qamrul Habib, Scientific Officer, SRDI, and project staff of the BARC (Bangladesh Agricultural Research Council) Computer Centre who carried out the computer data processing on which the tables in the report series are based.
- Mr D. Mazzei, Cartographer, who organized the drafting and printing of the maps and figures in the reports.
- The farmers of Bangladesh whose skill and experience in adapting their cropping and farming systems to the multitude of micro-agroecological environments in the country provide the basis for much of the agricultural information given in Report 2.

Chapter 1

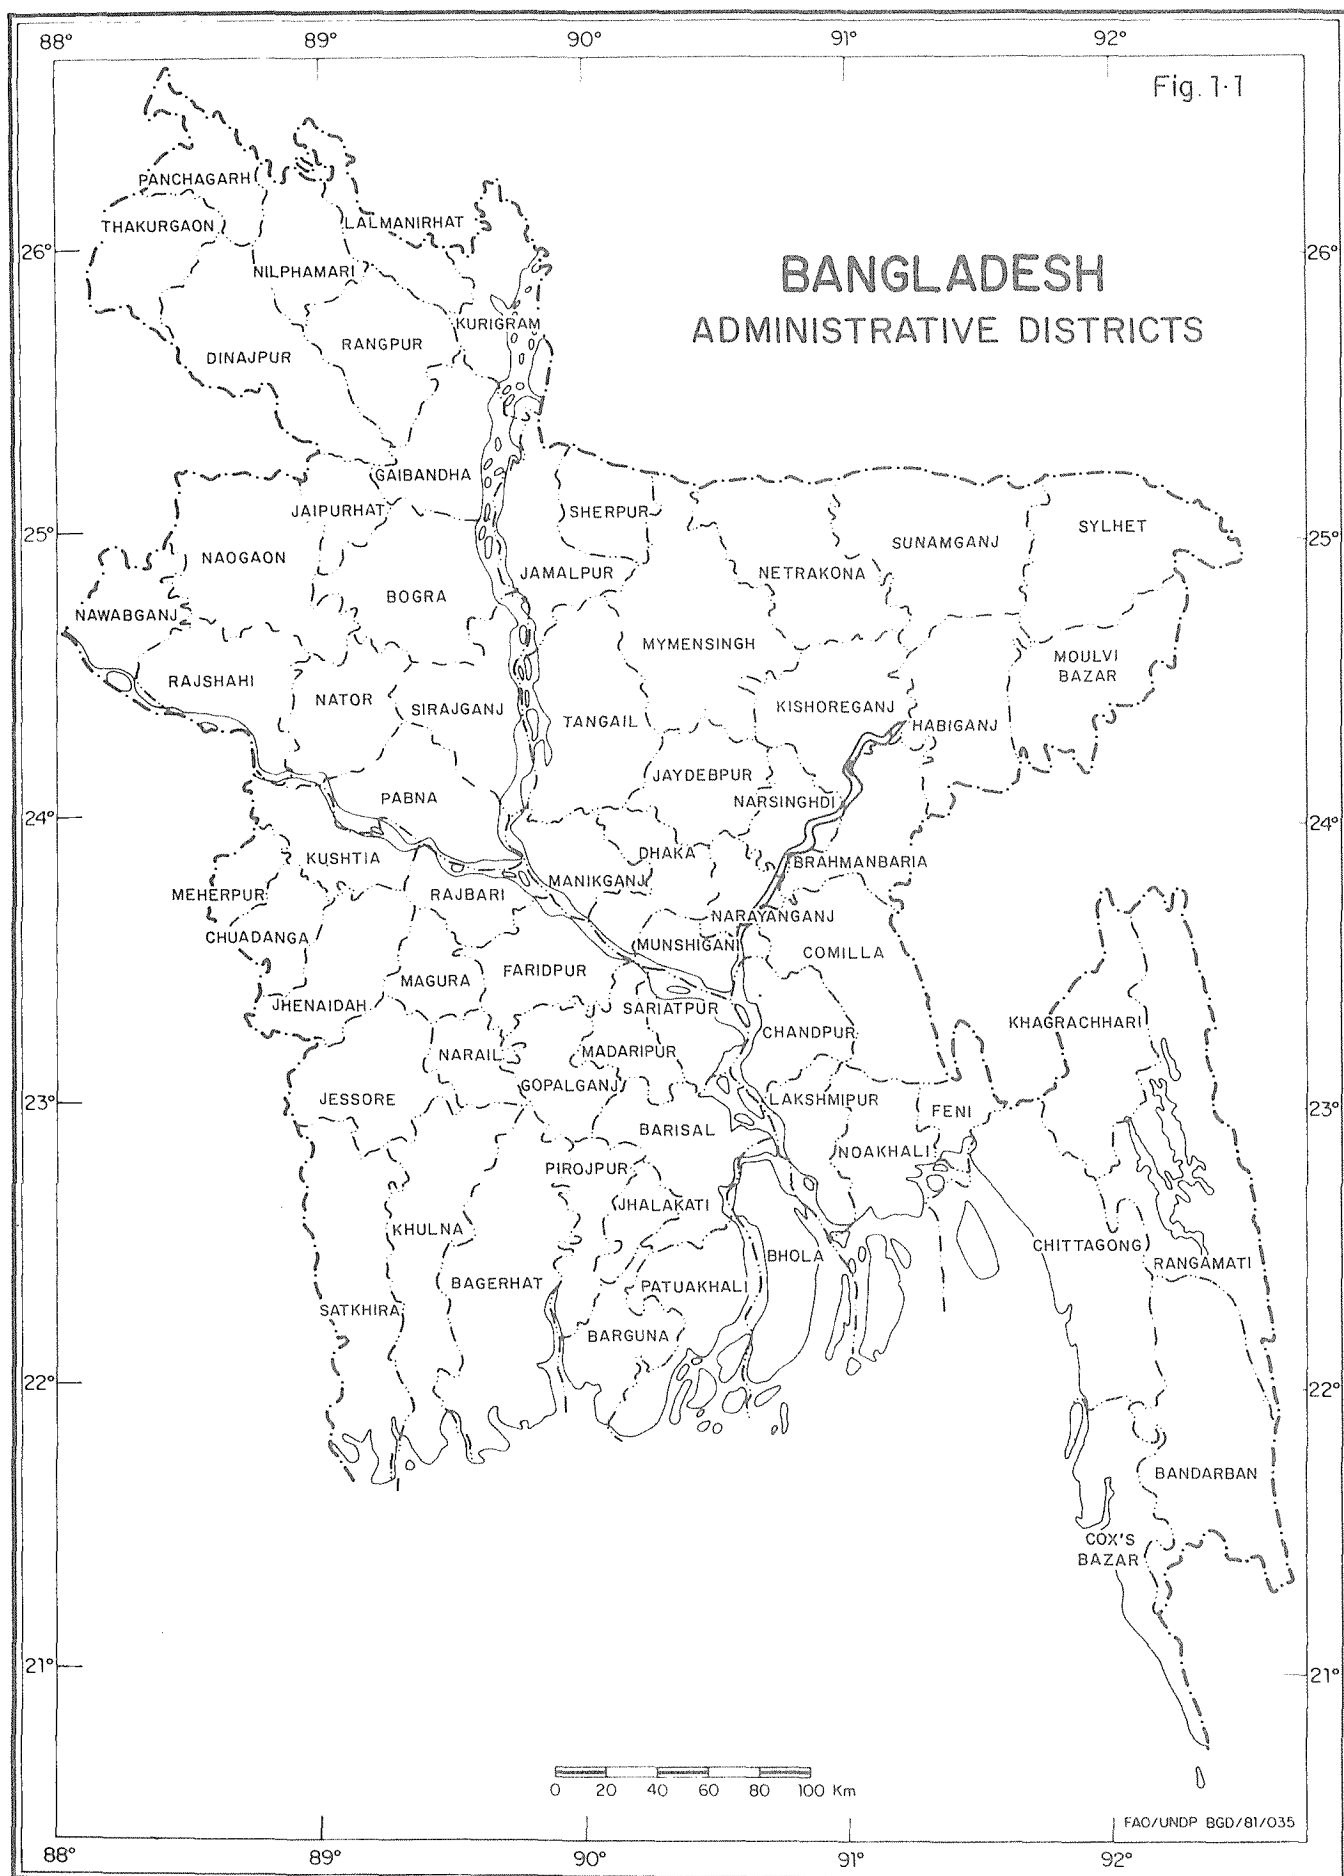

INTRODUCTION

Report 3 deals with the land resources data base developed for use in the land resources appraisal of Bangladesh. The Report comprises two volumes. Volume I deals with the climatic data base; Volume II deals with the soil, landform, and hydrological data base.

The data base provides a 'permanent' record of natural resources information for future use, and forms the information source in the compilation of the inundation resources inventory described in Report 4, Volume II, and the land resources inventory described in Report 5.

The 64 administrative Districts and 486 Upazilas into which Bangladesh is divided are listed in Appendix 1.1, and a District map is presented in Figure 1.1.

Fig. 1-1

Chapter 2

SOIL AND LANDFORM DATA BASE

The main source of information on soils and landforms for the compilation of the data base is the reconnaissance soil survey reports published by the Soil Resources Development Institute (SRDI). The information for almost the whole country ^{1/}, mapped at 1:125,000 scale, is contained in 34 survey reports, which are listed in Table 2.1.

Data from all survey areas except the Chittagong Hill Tracts were available in computerized form through the Bangladesh Soil Survey Data Processing System (BANGLA SODAPS) (Antoine, 1982). Information on inundation depths for the following survey areas was revised in 1984 (Ibrahim, 1984):

Jamalpur Subdivision
Tangail District
Netrakona and Sadar North Subdivisions, Mymensingh District
Faridpur Sadar and Goalundo Subdivisions
Gopalganj and Madaripur Subdivisions, Faridpur District
Kushtia District
Rajshahi District
Pabna District
Bogra District and part of Dinajpur Sadar Subdivision
Brahmanbaria Subdivision.

Information for the surveyed area of the Chittagong Hill Tracts became available in 1986 and was added to the data base.

The make-up of the soil and landform data base is shown in Figure 2.1.

2.1 SOIL ASSOCIATIONS

In Bangladesh, individual soils can rarely be mapped as pure units at the 1:125 000 scale used on the reconnaissance soil surveys. In these circumstances, the different soils which occur within a physiographic unit or subunit are mapped together as a soil association; (see Report 5 for details). A typical soil association is illustrated and explained in Figure 2.2. The relationship of the component soils to the landscape of the soil association is shown schematically in Figure 2.3.

A total of 1 034 individual soil associations has been inventoried. Each soil association is unique because its landform and soil series composition is unique. An example of the composition of a soil association is given in Table 2.2. Appendix 2.1 presents a list of all soil associations together with their area and component soil series. The soil associations have been numbered serially from north to south within survey areas. Each soil association number is prefixed with a symbol indicating the physiographic unit or subunit in which the association occurs.

^{1/} Reserved Forest areas of the Khulna Sunderbans and the former Chittagong Hill Tracts, and small areas within the boundaries of the Thakurgaon, Rangpur-Nilphamari and Sylhet-Moulvi Bazar report areas, were not surveyed.

1/ Computer codes for physiographic units and their subdivisions are listed in Appendix 2.2.

2.2 SOIL SERIES

The individual soil units identified on the reconnaissance soil surveys are termed soil series. A soil series is a group of soils formed in the same (or closely similar) parent material, with a similar arrangement of horizons (layers) and with closely similar distinguishing characteristics (e.g., subsoil texture, colour, structure, reaction). A total of 574 soil series has been inventoried, together with their individual extents and their landform, physical and chemical characteristics (see Appendix 2.3, where the series are listed in alphabetical order). Landform, physical and chemical characteristics are explained in Sections 2.2.1 to 2.2.3.

2.2.1 Landform characteristics

Landform information in the data base comprises physiography, land type, relief, slope and erosion status of the landscape in which the individual soil series occur.

(a) Physiography (Symbol PU)

The term physiography includes the combination of the geological material in which particular kinds of soil have formed and the landscape on which they occur. Twenty physiographic units have been recognized, some of which have been divided into subunits (see Table 2.3). Physiographic units and subunits are described in Report 5. A simplified physiography map is presented in Figure 2.3.

(b) Land type (Symbol LT)

Six main hydrological land types are recognized in Bangladesh. Each of them is related to a specific range of inundation depth during the kharif (rainy) season. Some land types are further subdivided depending on whether or not they remain wet throughout the rabi (dry) season. Land which is inundated in the kharif season and remains wet through the dry season is termed Bottomland. Thus, a total of 11 land types occurs, as detailed below.

<u>Code</u>	<u>Symbol</u>	<u>Land type</u>	<u>Description</u>
1	H	Highland	Land which is above normal inundation level
2	MH1	Medium Highland 1	Land which normally is inundated less than 30 cm deep
3	MH1b	Medium Highland 1, Bottomland	As above, but remains in a wetland state throughout the year
4	MH2	Medium Highland 2	Land which normally is inundated in the range 30-90 cm deep
5	MH2b	Medium Highland 2, Bottomland	As above, but remains in a wetland state throughout the year
6	ML	Medium Lowland	Land which normally is inundated in the range 90-180 cm deep
7	MLb	Medium Lowland, Bottomland	As above, but remains in a wetland state throughout the year
8	L	Lowland	Land which normally is inundated in the range 180-300 cm deep
9	Lb	Lowland, Bottomland	As above, but remains in a wetland state throughout the year
10	VL	Very Lowland	Land which normally is inundated more than 300 cm deep
11	VLb	Very Lowland, Bottomland	As above, but remains in a wetland state throughout the year

Notes : 1 Adopted from Noakhali-Comilla reconnaissance soil survey report: Comilla soil association 17

2 Abbreviations. Colour : o=olive g=grey og=olive-grey dg=dark grey yb=yellow-brown dog=dark olive-grey

lob=light olive-brown vdg=very dark grey vdgb=very dark grey-brown

Texture : sil=silt loam sicl=silty clay loam sic=silty clay

Laboratory data : OM = organic matter

3 Laboratory data show results for single profiles. They do not indicate range in contents within the series

(c) Relief (Symbol RE)

Relief characteristics of the land were inventoried in terms of five types, as follows:

<u>Code</u>	<u>Description</u>
1	Regular (= smooth)
2	Irregular
3	Broadly dissected
4	Closely dissected
5	Deeply dissected

(d) Slope (Symbol SL)

Six slope classes have been employed, as follows:

<u>Code</u>	<u>Slope (%)</u>
1	<3
2	3-8
3	8-16
4	16-30
5	30-45
6	>45

(e) Erosion status (Symbol ES)

Erosion status of the landscape has been characterized in two classes:

<u>Code</u>	<u>Description</u>
1	Topsoil not eroded
2	Topsoil eroded

2.2.2 Physical characteristics

For each soil series, seven physical characteristics have been inventoried (Zijssvelt, 1980): topsoil texture; effective soil depth; presence or absence of very firm/hard ploughpan; available moisture holding capacity; permeability; drainage; and consistence.

(a) Topsoil texture (Symbol TX)

<u>Code</u>	<u>Descriptive name</u>
1	Sand
2	Loamy sand
3	Loamy fine sand
4	Sandy loam
5	Fine sandy loam
6	Very fine sandy loam
7	Gravelly sandy clay loam
8	Sandy clay loam
9	Loam
10	Silt
11	Silt loam

<u>Code</u>	<u>Descriptive name</u>
12	Gravelly silt loam
13	Silty clay loam
14	Clay loam
15	Silty clay
16	Clay
17	Mucky clay
18	Muck
19	Peaty muck
20	Peat

(b) Effective soil depth (Symbol SD)

<u>Code</u>	<u>Depth</u>	<u>Descriptive name</u>
1	<25	Very shallow soil
2	25-60	Shallow soil
3	60-90	Deep and very firm soil
4	90-122	Deep and firm soil
5	>122	Deep and friable soil

(c) Presence or absence of very firm/hard ploughpan (Symbol PP)

<u>Code</u>	<u>Descriptive name</u>
1	No ploughpan
2	Ploughpan present

(d) Available moisture holding capacity (AMHC) (Symbol SM)

<u>Code</u>	<u>Capacity (mm)</u> (within effective soil depth)	<u>Descriptive name</u>
1	<100	Very low AMHC
2	100-200	Low AMHC
3	200-300	Moderate AMHC
4	300-400	High AMHC
5	>400	Very high AMHC

(e) Permeability (Symbol SP)

<u>Code</u>	<u>Rate (cm/day)</u>	<u>Descriptive name</u>
1	<12	Slowly permeable
2	12-305	Moderately permeable
3	>305	Rapidly permeable

(f) Drainage (Symbol DR)

<u>Code</u>	<u>Descriptive name</u>
1	Well to excessively drained
2	Moderately well drained
3	Imperfectly drained
4	Poorly drained, but surface drains early (before mid-November)
5	Poorly drained, but surface drains late (after mid-November)
6	Very poorly drained

(g) Consistence (Symbol SC)

<u>Code</u>	<u>Description</u>
1	Mineral surface soil not more than slightly firm/slightly sticky/slightly plastic/slightly hard
2	Mineral surface soil firm/very firm/sticky/plastic/hard/very hard
3	Mineral surface soil extremely firm/very sticky/very plastic/extremely hard
4	Organic soil, organic material to at least 25 cm below the surface

2.2.3 Chemical characteristics

Six chemical characteristics have been inventoried for each soil series (Zijssvelt, 1980): reaction; natural nutrient status; salinity; alkali phase; petrocalcic phase; and acid sulphate phase.

(a) Reaction (Symbol pH)

<u>Code</u>	<u>pH</u>	<u>Description</u>
1	<4.5	Extremely acid
2	4.5-5.5	Strongly to very strongly acid
3	5.5-7.3	Moderately acid to neutral
4	7.3-8.4	Mildly to moderately alkaline
5	>8.4	Strongly to very strongly alkaline

(b) Natural nutrient status (Symbol NS)

<u>Code</u>	<u>Description</u>
1	Low: relatively infertile
2	High: relatively fertile

(c) Salinity (Symbol SI)

<u>Code</u>	<u>EC (mmhos/cm)</u>	<u>Description</u>
1	<2	Non-saline
2	2-4	Very weakly saline
3	4-8	Weakly saline
4	8-15	Moderately saline
5	>15	Strongly saline

(d) Alkali phase (Symbol AL)

<u>Code</u>	<u>Description</u>
1	No alkali phase
2	Alkali phase

(e) Petrocalcic phase (Symbol CA)

<u>Code</u>	<u>Description</u>
1	No petrocalcic phase
2	Petrocalcic phase

(f) Acid sulphate phase (Symbol AS)

<u>Code</u>	<u>Description</u>
1	No acid sulphate phase
2	Acid sulphate phase

2.3 SOIL CORRELATION

Soil series have been correlated with soil parent materials, and with units of three soil classification systems: the General Soil Types of Bangladesh; the Legend of the FAO/Unesco Soil Map of the World; and the USDA Soil Taxonomy. This correlation is presented in Appendix 2.4, in which the soil series are listed in alphabetical order. The units of the three soil classification systems are described in Report 5.

(a) Soil parent materials

Soil parent materials are the geological materials in which individual soils have formed. Twenty different kinds of parent material have been recognized. They are listed in Table 2.4. These materials largely determine the sand and clay mineralogy of the soils formed in them, but modified to varying degrees by weathering and enrichment by soil forming processes.

(b) General soil types

The soils of Bangladesh have been classified within a local system of General Soil Types which are listed in Table 2.5. They are defined in Reports 2 and 5. Correlation of soil series in the General Soil Types is shown in Appendix 2.3; the soil series are listed in alphabetical order.

(c) FAO soil units

The soil units and subunits of the Legend for the FAO-Unesco Soil Map of the World (FAO, 1985) present in Bangladesh are shown in Table 2.6. They are defined in Report 5. Correlation of soil series in the FAO system is presented in Appendix 2.3; the soil series are listed in alphabetical order.

(d) USDA Soil Taxonomy units

Table 2.7 lists the subgroups of the USDA Soil Taxonomy (USDA, 1975) which have been identified in Bangladesh, as well as the simplified texture, mineralogy and reaction classes used for differentiating soil families. Correlation of soil series in the USDA system is presented in Appendix 2.3, where the soil series are listed in alphabetical order. The information given on the USDA soil families can be applied also to the General Soil Types and FAO soil units/subunits. The three family code numbers given in Appendix 2.4 refer to texture, mineralogy and soil reaction classes respectively, as defined in the table below.

USDA SOIL TAXONOMY FAMILY CODE

<u>Code</u>	<u>Texture</u>	<u>Code</u>	<u>Mineralogy</u>	<u>Code</u>	<u>Soil reaction</u>
0	Not indicated	0	Not indicated	0	Not indicated
1	Loamy-skeletal	1	Mixed	1	Calcareous
2	Sandy	2	Kaolinitic	2	Non-acid
3	Loamy	3	Montmorillonitic	3	Acid
4	Clayey				

Table 2.4 LIST OF SOIL PARENT MATERIALS

Code	Name
1	Tertiary rocks
2	Madhupur clay
3	Madhupur clay alluvium
4	Old Himalayan Piedmont Plain alluvium
5	Tista alluvium
6	Atrai alluvium
7	Karatoya-Bangali alluvium
8	Jamuna alluvium
9	Old Brahmaputra alluvium
10	Surma-Kusiyara alluvium
11	Middle Meghna alluvium
12	Lower Meghna river alluvium
13	Old Meghna estuarine alluvium
14	Young Meghna estuarine alluvium
15	Minor eastern rivers alluvium
16	Ganges river alluvium
17	Ganges tidal alluvium
18	Northern and Eastern Piedmont Plains alluvium
19	Peat
20	Chittagong Coastal Plains alluvium

Table 2.5 LIST OF GENERAL SOIL TYPES

Code	Name
1	Calcareous Alluvium
2	Noncalcareous Alluvium
3	Calcareous Brown Floodplain Soil
4	Calcareous Grey Floodplain Soil
5	Calcareous Dark Grey Floodplain Soil
6	Noncalcareous Grey Floodplain Soil
7	Noncalcareous Brown Floodplain Soil
8	Noncalcareous Dark Grey Floodplain Soil
9	Black Terai Soil
10	Acid Basin Clay
11	Acid Sulphate Soil
12	Peat
13	Grey Piedmont Soil
14	Brown Hill Soil
15	Shallow Red-brown Terrace Soil
16	Deep Red-brown Terrace Soil
17	Brown Mottled Terrace Soil
18	Shallow Grey Terrace Soil
19	Deep Grey Terrace Soil
20	Grey Valley Soil
21	Man-made land

- 13 Brown Hill Soils
- 14 Shallow and Deep Grey Terrace Soils
- 15 Deep Red-Brown Terrace Soils

Note: Only the principal General Soil Type of each map unit is indicated. A more detailed soils legend is given on the Agroecological Regions and Subregions Map in Report 2.

Chapter 3

HYDROLOGICAL DATA BASE

The hydrological data base comprises information on (a) normal depth of inundation; (b) flood hazards; and (c) groundwater levels. The hydrological information is linked to the information on soil associations at the soil series level (see Appendix 3.1).

3.1 DEPTH OF INUNDATION

As described in Section 2.2.1b, six basic hydrological land types are recognized in Bangladesh, each related to a specific range of inundation depths during the kharif season. These are: land not normally inundated (Highland), normal inundation less than 30 cm (Medium Highland 1), normal inundation in the range 30-90 cm (Medium Highland 2), normal inundation in the range 90-180 cm (Medium Lowland), normal inundation in the range 180-300 cm (Lowland) and normal inundation deeper than 300 cm (Very Lowland).

A generalized map of inundation depths is shown in Figure 3.1, and a schematic transect relating land type to inundation level is presented in Fig. 3.2; (see also Figure 2.3).

As already mentioned in Sections 2.1 and 2.2, the information on land type/inundation depth is available in the data bank for every soil association and soil series.

3.2 FLOOD HAZARD

Three types of flood hazard have been inventoried using five classes of frequency of occurrence: <2%, 2-6%, 6-20%, 20-50% and >50% of years. The three types of flood hazard are:

- (a) Disastrous flooding due to rapidly rising and/or flowing flood water (code z).
- (b) Disastrous flooding accompanied by river erosion and/or deposition of fresh alluvium (code x).
- (c) Disastrous flooding due to storm surges, with or without cyclones (code y).

The percentage proportion of the land type which is affected by the relevant flood hazard(s) has also been inventoried.

The above information in the data base relates to every soil association at the soil series level. An extract of the information on land type and flood hazard by soil association is presented as an example in Appendix 3.1. The country summary of inundation depth and flood hazards is presented in Table 3.1.

3.3 GROUNDWATER LEVEL

Groundwater level data were obtained from the Bangladesh Water Development Board (BWDB). The data were edited with advice from the Master Plan Organization (MPO). The

locations of selected wells were mapped on the land resources maps (see Report 5) to link the data to the soil and climate information.

In all, data from 309 dug wells and 126 piezometric wells were incorporated in the data base. The list of wells and their location characteristics are presented in Appendix 3.2. For each well, the data base has historical records. An example of such records is presented in Appendix 3.3. Mean groundwater level data for all wells are presented in Appendix 3.4.

The groundwater data have been used to characterize the inundation regimes of the soil associations served by the wells. This is described in Report 4, Volume II.

and their Subdivisions

Appendix 2.2

COMPUTER CODES FOR PHYSIOGRAPHIC UNITS AND THEIR SUBDIVISIONS

The following code symbols are used in the PU (Physiographic Unit) column in Appendix 2.3 to represent the primary, secondary and tertiary physiographic unit headings under which soil associations are arranged in the Land Resources Inventory Map legend in Report 5, Volume II, Appendix 4.2.

PHYSIOGRAPHIC UNITS OF BANGLADESH

AEZ PHYSIO- GRAPHIC UNIT NUMBER	AEZ PHYSIO- GRAPHIC UNIT CODE	PHYSIOGRAPHIC UNIT NAME
1.	010001	OLD HIMALAYAN PIEDMONT PLAIN:MAINLY RIDGES:MAINLY BLACK SOILS
2.	010002	OLD HIMALAYAN PIEDMONT PLAIN:MAINLY RIDGES:MAINLY BROWN SOILS
